

Solving System of Equations by Elimination

Main Ideas/Questions	Notes
WHAT IS IT?	An algebraic method to solve system of equations by adding equations to "cancel" or "eliminate" a variable.
STEPS TO SOLVE	<p><u>1.</u> Line up your variables. This is "Standard Form"</p> <p>STANDARD FORM: $Ax + By = C$</p>
	<p><u>2.</u> Determine which variable to "eliminate"</p> <p>Look for <u>opposite</u> coefficients. ELIMINATE a variable! by adding.</p>
	<p><u>3.</u> ADD the equations.</p> <p><u>Solve</u> for the variable!</p>
	<p><u>4.</u> Plug back in to find other variable.</p> <p><u>Substitute</u> the value of the variable into one of the original equations.</p>
	<p><u>5.</u> Check your solution!</p> <p>Substitute your ordered pair into <u>BOTH</u> equations.</p>

Directions: Solve the following systems using **ELIMINATION**.

1.) $x + y = 5$
 $3x - y = 7$

ADD

$$\begin{array}{r} x + y = 5 \\ 3x - y = 7 \\ \hline 4x = 12 \\ \hline x = 3 \end{array}$$

$x = 3$

$$\begin{array}{r} x + y = 5 \\ \downarrow \\ 3 + y = 5 \\ \underline{-3} \quad \underline{-3} \\ y = 2 \end{array}$$

$y = 2$

Solution:
(3, 2)

i ♥ SYSTEMS OF EQUATIONS!

2.) $4x + y = 7$
 $-(4x - 2y = -2)$
change all signs in 2nd equation!

ADD

$$\begin{array}{r} 4x + y = 7 \\ -4x + 2y = 2 \\ \hline 3y = 9 \\ \frac{3y}{3} = \frac{9}{3} \\ \boxed{y = 3} \end{array}$$

$$\begin{array}{r} 4x + y = 7 \\ 4x + 3 = 7 \\ \underline{-3} \quad -3 \\ 4x = 4 \\ \frac{4x}{4} = \frac{4}{4} \\ \boxed{x = 1} \end{array}$$

Solution: (1, 3)

3.) $2x - 3y = -2$
 $x + 3y = 17$

ADD

$$\begin{array}{r} 2x - 3y = -2 \\ x + 3y = 17 \\ \hline 3x = 15 \\ \frac{3x}{3} = \frac{15}{3} \\ \boxed{x = 5} \end{array}$$

$$\begin{array}{r} x + 3y = 17 \\ 5 + 3y = 17 \\ \underline{-5} \quad -5 \\ 3y = 12 \\ \frac{3y}{3} = \frac{12}{3} \\ \boxed{y = 4} \end{array}$$

Solution: (5, 4)

4.) $y = 7 - 2x$
 $4x + y = 5$

NOT IN STANDARD FORM!

$$\begin{array}{r} y = 7 - 2x \\ \underline{+2x} \quad \underline{+2x} \\ 2x + y = 7 \end{array}$$

$$\begin{array}{r} 2x + y = 7 \\ -(4x + y = 5) \\ \hline \end{array}$$

$$\begin{array}{r} 2x + y = 7 \\ -4x - y = -5 \\ \hline -2x = 2 \\ \frac{-2x}{-2} = \frac{2}{-2} \\ \boxed{x = -1} \end{array}$$

$$\begin{array}{r} y = 7 - 2(-1) \\ \boxed{y = 9} \end{array}$$

Solution: (-1, 9)
