

Functions Glossary

Word	Definition	Example/Picture
Function	A relationship in which every input (x) has exactly one output (y).	$\{(0,2), (1,5), (2,8)\}$
Function Notation	$f(x) = 3x+2$ The way a function is written. F(x) replaces 'y'.	$f(2) = 3(2)+2$ $f(2) = 8$
Input	A value substituted IN for an x-value. ['x', 'domain']	$f(2) = 8$
Output	A value substituted for y-value. ['y', 'range']	$f(2) = 8$
Domain "How Wide"	The complete SET of x-values used in the function. Left to Right	 $x = [-7, 7]$ $y = [-1, 7]$
Range "How Tall"	The complete SET of y-values used in the function. Low to High	
Set Notation	A collection of things (such as domain & range values) listed in {}.	Ex. From #1 $X = \{0, 1, 2\}$ $Y = \{2, 5, 8\}$
Interval Notation	Represents all values in between two numbers, using (or [for endpoints. Can also be shown as an inequality. $[-7, 7] \rightarrow -7 \leq x \leq 7$	See Example for Domain/Range
Turning Point	Where graph changes direction. (increase/decrease) A max or min value.	
Maximum	The highest point on a graph.	
Minimum	The lowest point on a graph.	
y-intercepts	Where the graph crosses the Y-axis! (where $x=0$)	 $x = \{-4, -6\}$
x-intercepts	Where the graph crosses the X-axis (where $y=0$) also called the ZEROES of the function.	
Zeroes	(Solutions).	
Positive	Where the graph is above the x-axis (in the POSITIVE y-values).	 $\text{only negative from } -6 < x < -4$
Negative	Where the graph is below the x-axis (in the NEGATIVE y-values).
